

PORTFOLIO

Aegis Warden

One click fixes for network and Windows problems, with a log that tells the truth.

Juan Paolo Dente · C# and Windows Forms · v1.1

WHY I BUILT IT

I kept fixing the same problems by hand

The problem

Slow internet, a stuck print queue, a PC that drags. Each fix is a few commands, and I never remembered all of them.

First version

A PowerShell script called Agent Juan Toolkit. It worked, but it was a console menu that was hard to share.

Now

Aegis Warden: one .exe with a dashboard, a live log and one click fixes. The same fixes, a better way to run them.

WHAT IT DOES

32 fixes in a few clear groups

Networking

DNS, IP and the one click network reset.

Diagnostics

Wi-Fi Report and Slow PC Check.

Disk and system

Disk checks and SFC repair.

Printing

Clear a stuck print queue.

Tools

Ping, trace and DNS lookup.

Knowledge Base

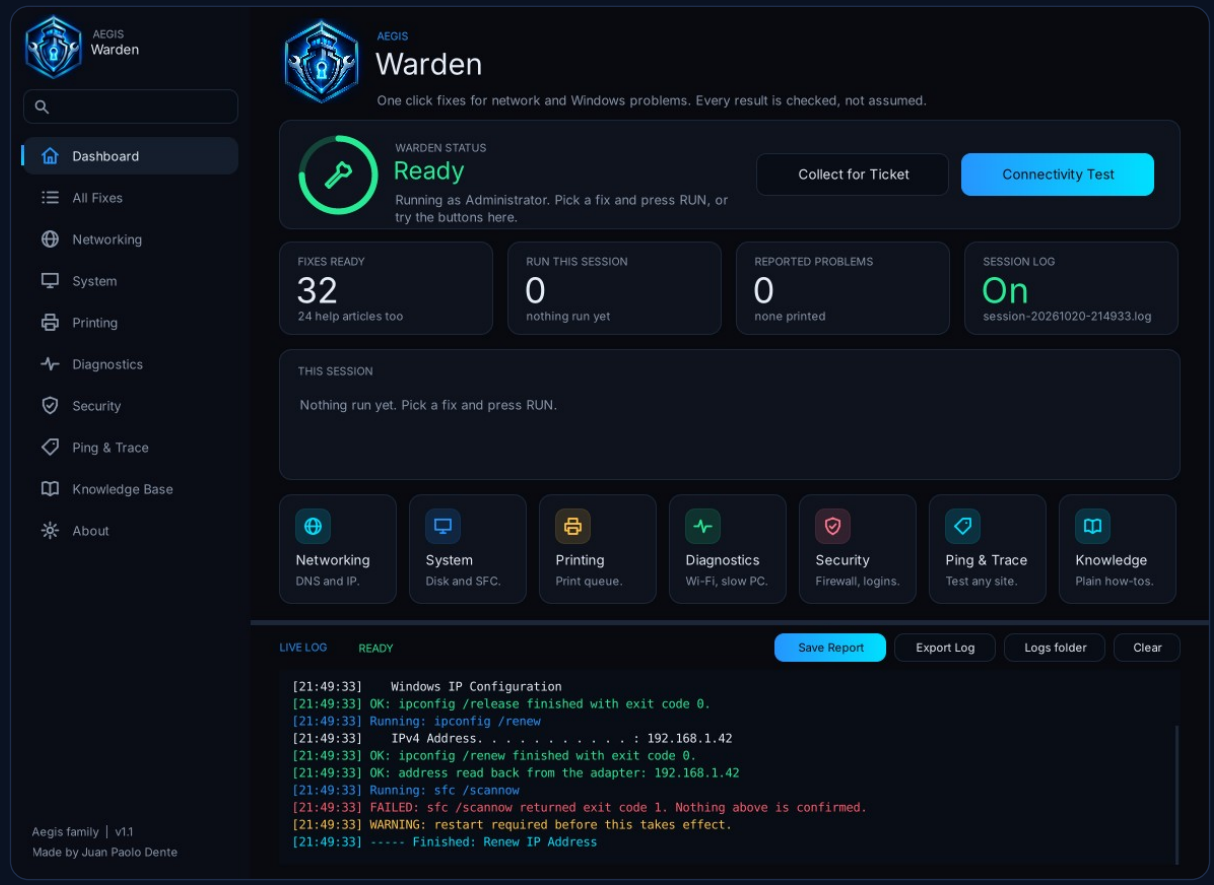

24 plain language articles on each problem.

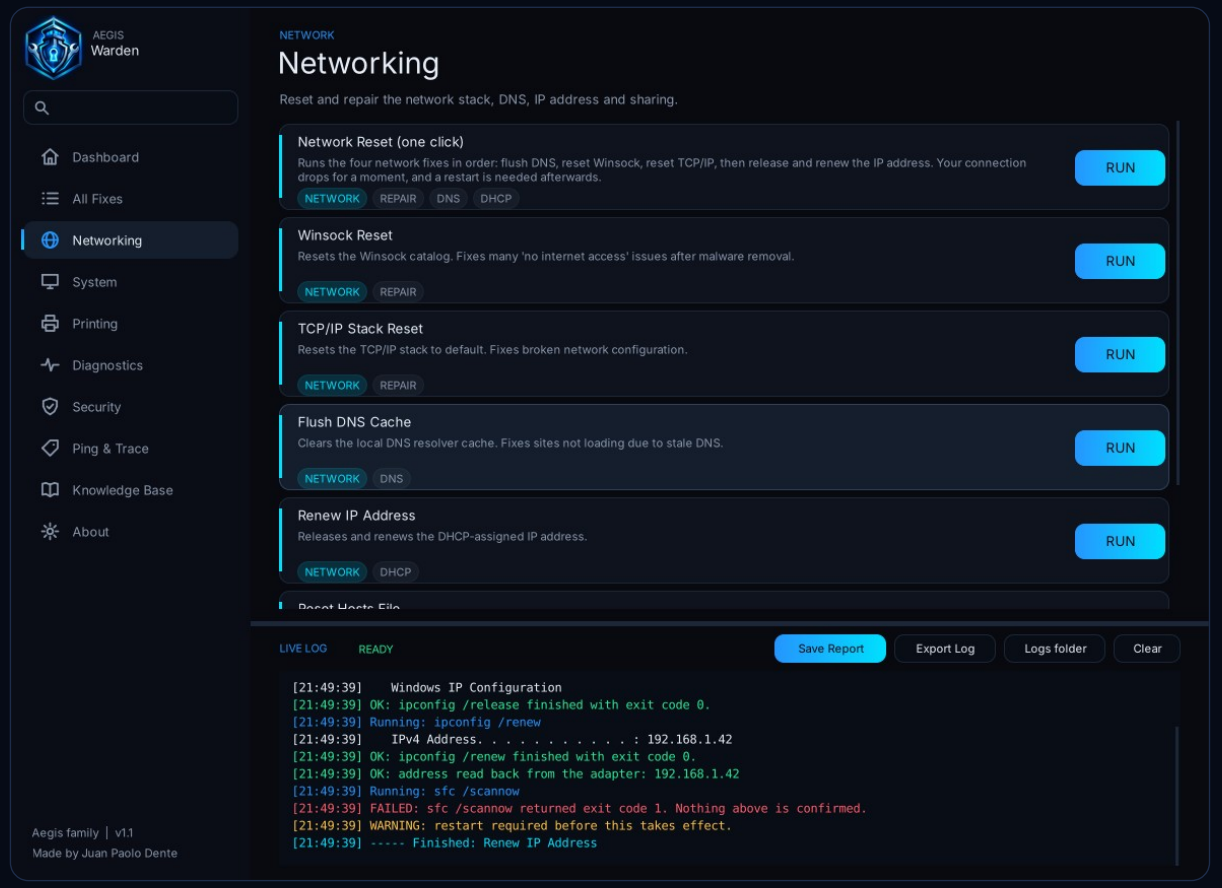

THE DASHBOARD

Start here, fix from here

The home page shows the tool tiles, a summary of what ran this session and the live log on the side.

Click a tile and it asks once before it runs.

NETWORKING

Internet problems, one click each

Flush DNS, renew the IP, test the connection, or run the full Network Reset in a single click.

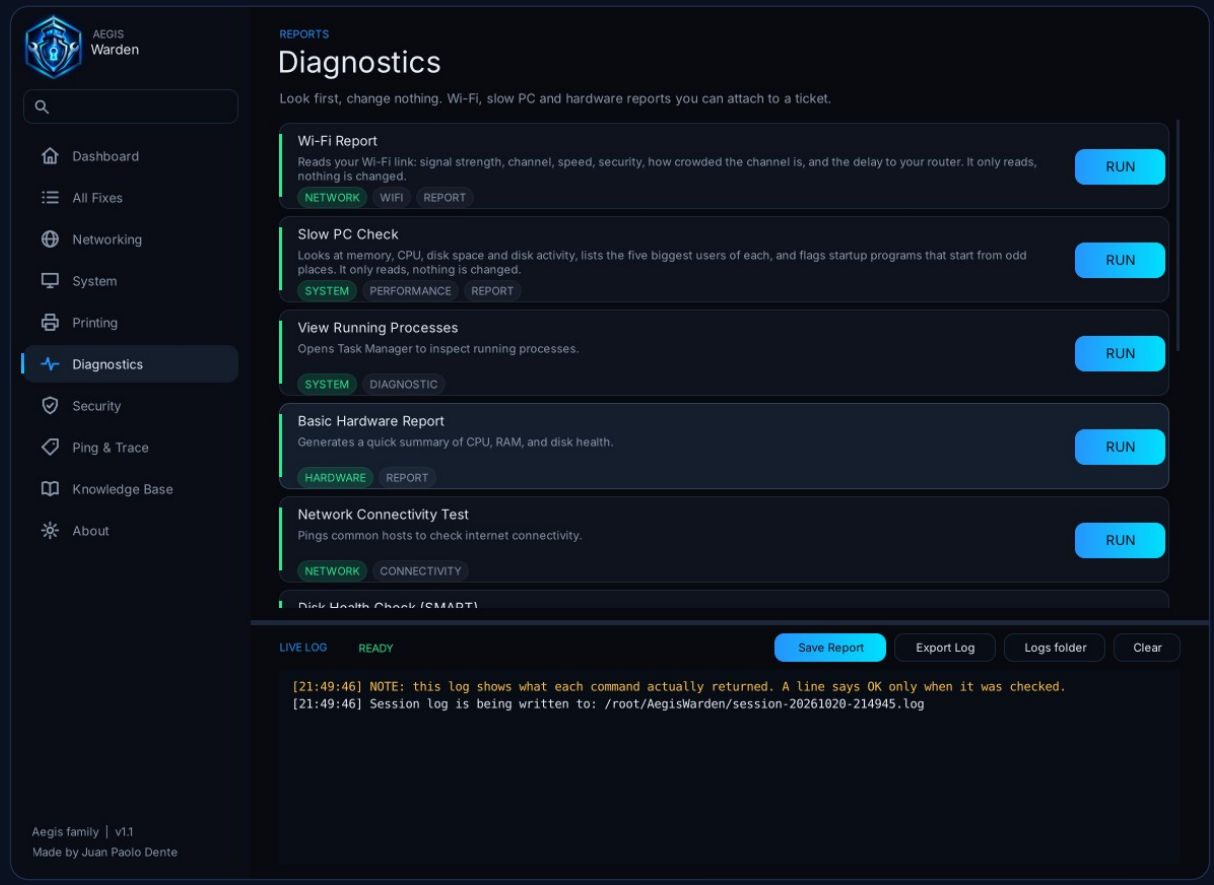

Each one asks before it runs and writes every step to the log.

DIAGNOSTICS

Find the cause before fixing

Wi-Fi Report builds Windows' own wireless history. Slow PC Check looks at what is eating the machine.

Both only read information. They change nothing.

NEW IN VERSION 1.1

Five things added this round

Network Reset

The whole reset sequence in one click.

Wi-Fi Report

Windows' wireless history report.

Slow PC Check

Shows what is slowing the PC down.

Ping and Trace

Type a host, then ping, trace or look up DNS.

Save Report

A text report of everything that ran.

Same honesty

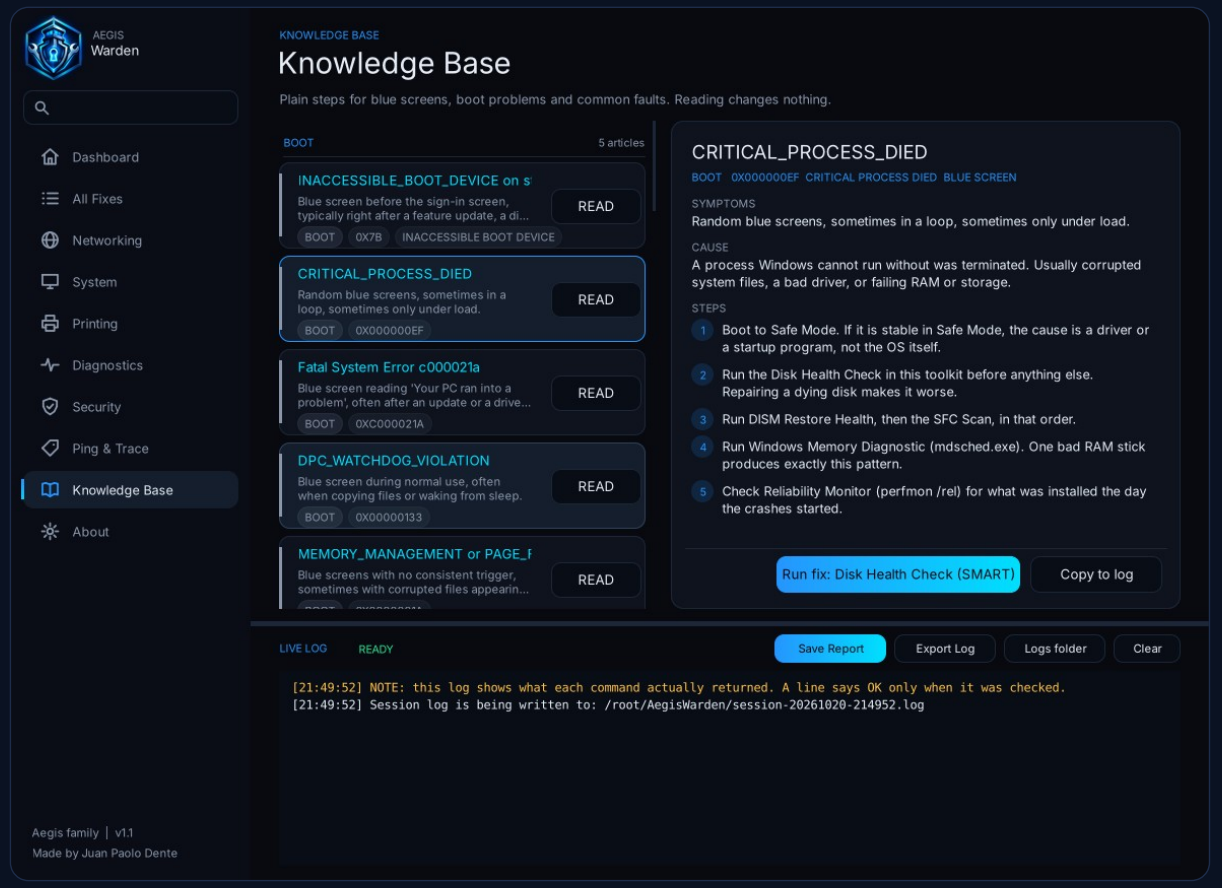

All of them report FINISHED, PROBLEMS or STOPPED.

THE RULE

The log never claims success it did not check

FINISHED | PROBLEMS | STOPPED

If a line says FAILED, ERROR, WARNING or Could not, the run is marked PROBLEMS.
Cancel stops the whole process tree.

KNOWLEDGE BASE

Learn why, not only how

24 short articles explain each problem in plain words, so the fix is not a black box.

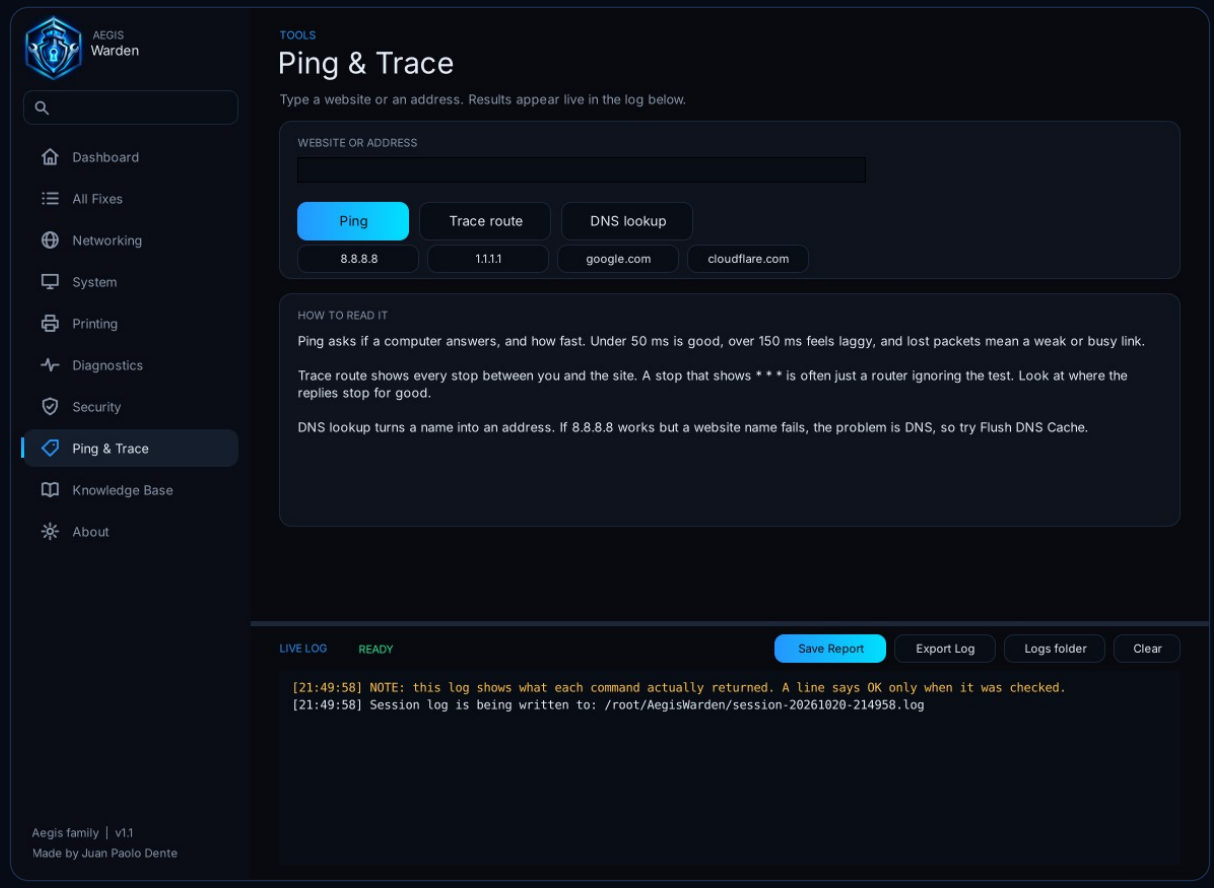

There is also a search box that finds fixes and articles together.

PING AND TRACE

Type a host, get an answer

Ping, trace route and DNS lookup for any address, with the results streaming into the log.

The host name is checked first, so odd characters never reach the command line. These are read only, so they run without a confirm box.

HOW IT IS BUILT

Same fixes, a safer way to run them

Original code kept

The PowerShell fix bodies from my old toolkit are kept as they were, so results match.

The runner

Each fix goes to a temp script and runs in a hidden PowerShell on a background thread. The window never freezes.

The log

Output streams in with time stamps and is also saved to a session file in Documents.

C# with Windows Forms, one .exe, runs as administrator. One fix at a time, and the window will not close while one is running.

TESTING AND LIMITS

What is checked, and what is not yet

Checked so far

- It compiles and every page opens
- The log colors, search, cancel and report layout were checked on screen
- [Add what you test on your PC]

Honest limits

- The fixes were not run on a real Windows PC yet, only built and viewed
- Wi-Fi Report, Slow PC Check and Network Reset need real tests
- Fixes change real settings, so read each prompt
- Some fixes need administrator rights

WHAT IS NEXT

Where Warden goes from here

Test on real PCs

Run every new fix on a few machines and fix what breaks.

Scheduled checks

A weekly Slow PC Check that reports by notification.

One installer

Ship Warden with the whole Aegis family in one setup.

Code signing

So Windows SmartScreen stops warning when it is shared.

Thank you
